Approach:

- **'get_params' function:** Computed different probability distribution parameters and prior probabilities based on formulas found on the internet.
- **'predict' function:** Calculated different **log probabilities** of a label for all distribution functions and then added them. Did this for every label and stored in a prediction variable. Next used argmax function for predicting the label and get the final predictions.
- Implemented **'precision'**, **'recall'** and **'f1-score'** using formulas given on the internet.

Different Parameter Values:

1. **Priors:** {0: 0.3333333333333333, 1: 0.3333333333333333, 2: 0.3333333333333333}
